

# How long do people living in the same house as someone with COVID need to quarantine?

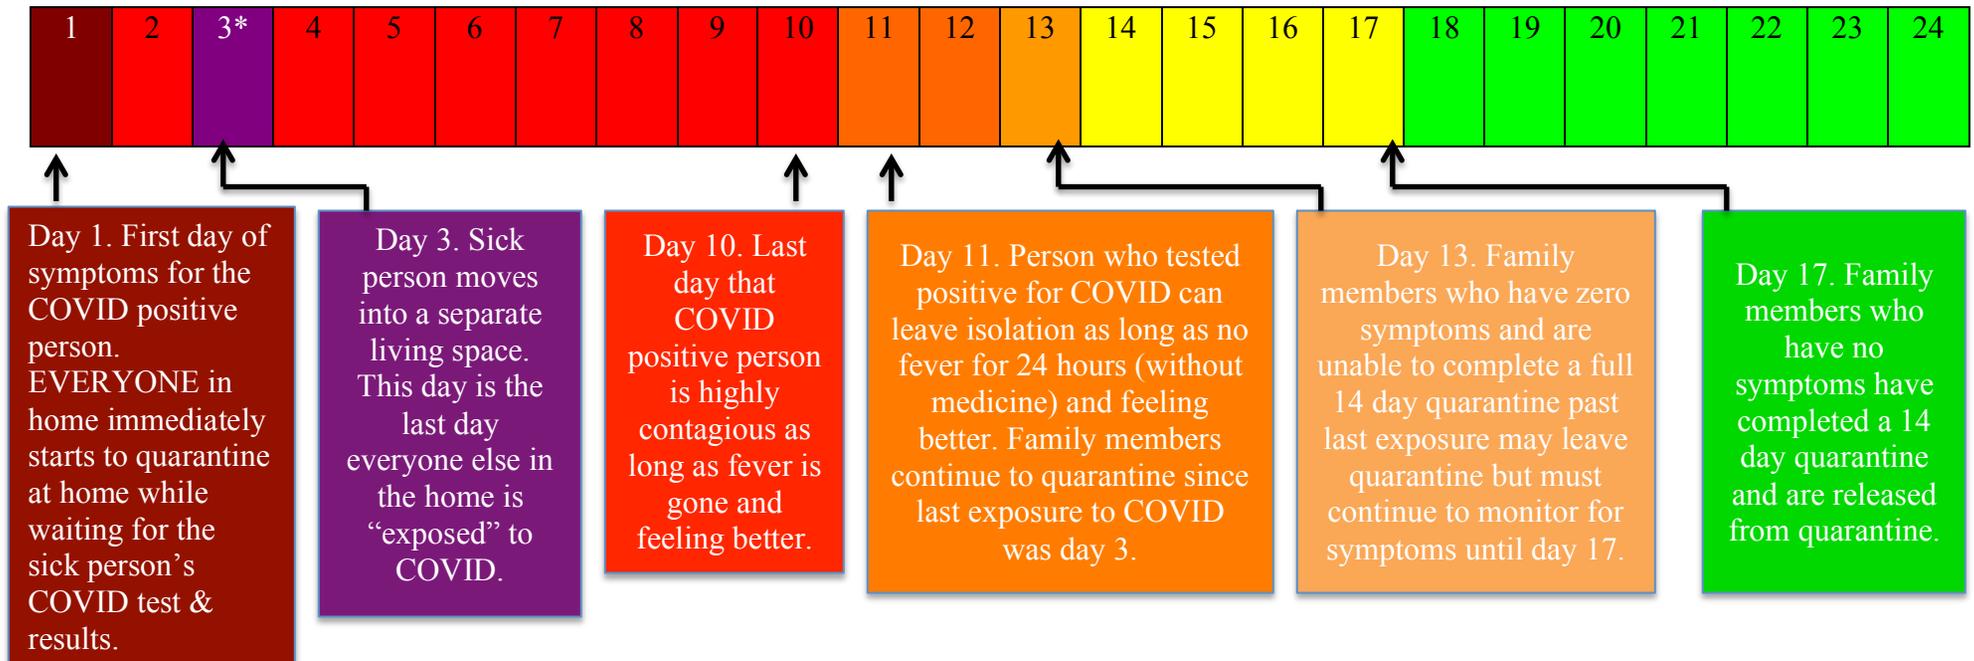

**Situation 1: You are unable to separate the COVID positive person from everyone else in the home.**

- If anyone in the house is tested for COVID-19 for any symptom, no matter how mild, the entire household must quarantine at home until results come back.
- Anyone with COVID-19 has to quarantine until 10 days after their first symptom. On the 11<sup>th</sup> day, you are allowed to leave quarantine as long as you are feeling better and have been fever free (without taking medications) for over 24 hours.
- Anyone exposed to COVID-19 has to quarantine until 14 days after their last exposure. Every day you are around a family member who currently has COVID-19 counts as another exposure.
- Anyone in quarantine may only leave your property to seek urgent medical care. (The exception is you may go on a walk if you mask and stay well over 6 feet away from other people.)
- Everyone in the family over age 2 should wear a mask at home during the day.
- Please contact people the sick person saw in the 48 hours prior to developing symptoms to let them know they have been exposed and should quarantine too.
- If a second person in the home becomes ill, it resets the quarantine clock for all asymptomatic household members.
- Contact your doctor's office with any questions.

# How long do people living in the same house as someone with COVID need to quarantine?

**Situation 2: You ARE able to separate the COVID positive person from everyone else in the home. (This means the sick person has a separate bedroom and bathroom, closed off from the rest of the family, and is out of that space for <15 minutes per 24 hours. They must be masked during their few minutes in the house where they are out of their room.) For this example, we will assume that the COVID positive person is able to start isolating in their separate bedroom/bathroom on day 3\*.**
